

## Four's a Winner

Players 2

Game can be adapted to play individually

### Materials

- Four's a Winner game board
- 36 colored counters for each player. Each player needs a different colored set.
- 2 additional counters for factor rows

### How to play

1. Player 1 places a counter on one factor in each row at the bottom of the game board.
2. Player 1 determines the product and places a counter on that number.
3. Player 2 chooses one factor to change. For example, if player one placed one counter on 6 in the top factor row and a counter on 3 on the bottom factor row, then player 2 will choose to move either the counter on the 6 or the 3 to create a new multiplication problem.
4. Player 2 determines the product and places a counter on that number.
5. Players take turns changing one factor to make a new problem until one player has four counters in a row.
